

ABSTRACT

By providing a projection 24 at the root of a seal lip 22, the mechanical loss caused by the seal lip is reduced while restraining the turn-over of the seal lip 22, while maintaining a stable sealing performance by letting the first side surface 24a or the second side surface 24b of this projection 24 exhibit a suction function of returning the fluid that has leaked from the lip tip end of the seal lip 22 to the sealing fluid side. When the shaft and the seal lip 22 are relatively rotated.
